

STC PRODUCT SUITE

STC: IMMUNIZATION INTELLIGENCE

STC has a proud tradition of innovation in the immunization registry (IR) field. Our ever-stronger suite of products continues to add value and depth to the wealth of information in state health care databases. Pharmacists, large employers, health providers, and governments recognize that today, value lies not in **having data**, but in **using data to improve outcomes**.

As innovators with data, STC has long been at the leading edge of our field. STC built the first immunization registries, and helped the CDC establish national IR standards. These registries were initially created as childhood immunization record systems. Many state databases now cover up to 80% of the states' population and track many immunization consumers from birth to death.

STC continues to build, maintain, and bolster quality health information systems that deliver greater value, depth, and intelligence from immunization registries.

Immunization-Intelligence™ (I²) is STC's axiom for the future. Our cloud-based products, coupled with new add-on consumer links like MyIR™, strengthen our ability to plug and play across the government as well as the health care provider, payer, and consumer sectors. I² improves the delivery of care, measures quality improvement programs, and enables consumers to easily track their own vaccine history. STC's I² products will advance vaccine prevention programs like never before.

Our health technology products and services empower physicians, nurses, hospital caregivers, pharmacists, insurers, public health professionals — and now, patients themselves. Through extraordinary products and exceptional service, we provide timely and accurate information when it is needed.

Our work has produced positive outcomes and improved lives for over 25 years, and we are well positioned to continue this trend long into the future.
